

Radio Interferometric Studies of Cool Evolved Stellar Outflows

A dissertation submitted to the University of Dublin
for the degree of Doctor of Philosophy

Eamon O’Gorman

Supervisor: Dr. Graham M. Harper

Trinity College Dublin, September 2013

SCHOOL OF PHYSICS
UNIVERSITY OF DUBLIN
TRINITY COLLEGE

Declaration

I declare that this thesis has not been submitted as an exercise for a degree at this or any other university and it is entirely my own work.

I agree to deposit this thesis in the University's open access institutional repository or allow the library to do so on my behalf, subject to Irish Copyright Legislation and Trinity College Library conditions of use and acknowledgement.

Name: Your Name

Introduction

Here is the introduction of the thesis, complete with a few references ([Prothero & Buell, 2007](#); [Sagan, 1997](#)). Section [1.2](#) contains Equation ??, Section ?? has Figure ?? and Section ?? has Table ??. Chapter ?? has pretty much nothing in it.

1.1 The problem

1.2 History

1.3 Radio Emission from Stellar Atmospheres

lamors and cass maybe radio HR diagram

1.3.1 Brightness Temperature

In thermodynamic equilibrium the spectral distribution or brightness, B_ν , of the radiation of a black body with temperature T is given by the Planck law

$$B_\nu(T) = \frac{2h\nu^3}{c^2} \frac{1}{e^{h\nu/kT} - 1} \quad (1.1)$$

and has units of flux per frequency interval per solid angle. One can easily switch to a wavelength scale using $B_\nu(T)d\nu = B_\lambda(T)d\lambda$. When $h\nu \ll kT$ Equation 1.1 becomes the *Rayleigh-Jeans Law*

$$B_\nu(T)d\nu = \frac{2\nu^2 kT}{c^2}. \quad (1.2)$$

This equation does not contain Planck's constant and therefore is the classical limit of the Planck Law. It can be used for all thermal radio sources except in the millimeter or sub-millimeter regime at low temperatures (Rohlfs & Wilson, 1996). In the Rayleigh-Jeans relation, the brightness is strictly proportional to the thermodynamic temperature of the black body. In radio astronomy it is customary to measure the brightness of an object by its *brightness temperature*, T_b . Therefore, the brightness temperature is the temperature at which a blackbody would have to be in order to reproduce the observed brightness of an object at frequency ν and is defined as

$$T_b = \frac{c^2}{2k\nu^2} B_\nu. \quad (1.3)$$

If $h\nu/kT \ll 1$ and if B_ν is emitted by a blackbody, then T_b is the thermodynamic temperature of the source. If other processes are responsible for the emission or

1.4 Stellar Radio Emission Mechanisms

if the frequency is so high that Equation 1.2 is not valid, then T_b is different from the thermodynamic temperature of a black body.

The equation of radiative transfer describes the change in specific intensity, I_ν , of a ray along the line of sight in a slab of material of thickness ds

$$\frac{dI_\nu}{ds} = \varepsilon_\nu - \kappa_\nu I_\nu \quad (1.4)$$

where ε_ν and κ_ν are the emissivity (in $\text{erg s}^{-1} \text{cm}^{-3} \text{Hz}^{-1} \text{sr}^{-1}$) and the absorption coefficient (opacity) (in cm^1) of a plasma of temperature, T_{eff} . In thermodynamic equilibrium the radiation is in complete equilibrium with its surroundings and the brightness distribution is described by the Planck function

$$\frac{dI_\nu}{ds} = 0, \quad I_\nu = B_\nu(T) = \frac{\varepsilon_\nu}{\kappa_\nu} \quad (1.5)$$

In local thermodynamic equilibrium (LTE), the emissivity and the opacity are related by Kirchhoff's law

$$B_\nu(T) = \frac{\varepsilon_\nu}{\kappa_\nu} \quad (1.6)$$

and so the radiative transfer equation can be wrote as

$$\frac{dI_\nu}{d\tau_\nu} = I_\nu - B_\nu(T) \quad (1.7)$$

where the optical depth, $d\tau_\nu$ is defined as

$$d\tau_\nu = -\kappa_\nu ds. \quad (1.8)$$

sub in t brightness and when its equal to temp or not.

optically thick/ thin (notes)

derive radio opacity and plot a graph as in notes

then what with a wind

1.4 Stellar Radio Emission Mechanisms

give example of flux from nearest star

into hr radio diagram

List of Abbreviations

Table A.1: List of Abbreviations

Abbreviation	Meaning
BIMA	Berkeley Illinois Maryland Association
CARMA	Combined Array for Research in Millimeter-wave Astronomy
CSE	Circumstellar Envelope
DDT	Director's Discretionary Time
e-MERLIN	e-Multi-Element Radio Linked Interferometer Network
FOV	Field of View
GREAT	German Receiver for Astronomy at Terahertz Frequencies
HPBW	Half Power Beamwidth
HST	Hubble Space Telescope
IOTA	Infrared Optical Telescope Array
IR	Infrared
IRAM	Institut de Radioastronomie Millimétrique
IUE	International Ultraviolet Explorer
LSR	Local Standard of Rest
MEM	Maximum Entropy Method
OVRO	Owens Valley Radio Observatory
RFI	Radio Frequency Interference
S/N	signal-to-noise
SOFIA	Stratospheric Observatory for Infrared Astronomy
SMA	Submillimeter Array
UV	Ultraviolet
VLA	Karl G. Jansky Very Large Array
VLBA	Very Long Baseline Array
VLT	Very Large Telescope
